PROFESSIONAL PROFILE

Data and Business Analyst completing an MSc in Business Analytics and Decision Science at the University of Leeds. Builds end-to-end analytical workflows — from data ingestion and modelling through to automated dashboards and executive briefings — using Python, SQL, and Power BI. Translates statistical outputs into commercial decisions, with a track record of quantified impact across risk segmentation, fraud detection, fairness evaluation, and performance reporting.

KEY ACHIEVEMENTS

- Cut manual reporting effort by 25% (3 hrs/cycle) by automating Power BI refresh and Excel pipelines across a multi-stakeholder marketing workflow.
- Identified a 3x missed payment rate differential between credit risk segments across 51,336 customer records, enabling prioritised allocation decisions.
- Exposed a 30% selection rate gap across 6+ demographic subgroups on 48,000+ income records — surfacing compliance risk invisible to standard accuracy metrics.
- Reduced false negatives by 40% in a fraud detection pipeline via recall-optimised threshold calibration, directly lowering simulated financial exposure.

TECHNICAL SKILLS

Languages and Tools: Python (pandas, NumPy, scikit-learn), SQL, R, Git

Reporting and Visualisation: Power BI (dashboard design, automated refresh), Tableau, Excel (PivotTables, advanced formulas)

Analytical Methods: Machine Learning, Monte Carlo Simulation, K-Means Clustering, Feature Engineering, Statistical Forecasting

Business Competencies: Stakeholder Communication, Data Ethics, Agile Delivery, Requirements Gathering, Executive Reporting

ANALYTICAL EXPERIENCE AND PROJECTS

Credit Risk Segmentation | Python, K-Means, PCA *github.com/doppy-bot/Credit-Risk-Segmentation*

- Processed 51,336 customer records across 8 financial variables; K-Means model (k=4) isolated a High Risk cohort with 3x the missed payment rate of the safest tier — delivering a segmentation framework for credit allocation without a labelled default variable.
- Designed a composite exposure-ranking model per segment, translating unsupervised outputs into a structured credit decision tool suitable for immediate business use.

Fairness and Bias in Income Prediction | Responsible AI, Logistic Regression *github.com/doppy-bot/Fairness-Bias-Income-Prediction*

- Achieved 85% classification accuracy on 48,000+ records; applied Demographic Parity, Disparate Impact Ratio, and Equal Opportunity metrics — uncovering a 30% selection gap across intersectional Gender x Race subgroups concealed by headline performance.
- Produced a non-technical stakeholder report covering proxy variable risk, remediation options, and ethical implications — bridging model output and organisational decision-making.

Premier League Season Forecast | Monte Carlo, Random Forest, REST API *github.com/doppy-bot/Premier_League_Prediction*

- Engineered 8+ rolling performance features from 380+ live API records; 5,000 Monte Carlo simulation runs generated probabilistic Title, Top 4, and Relegation outcomes for all 20 clubs — converting model uncertainty into risk-quantified strategic narratives.

Marketing Performance Dashboard | Power BI, Excel Automation

- Consolidated 3 manual reports into a 4-page self-serve Power BI dashboard covering 10+ KPIs (conversion rate, CAC, retention, revenue by segment); pipeline automation saved 25% effort per reporting cycle and eliminated version-control risk.

Click Fraud Detection | ML Pipeline, Imbalanced Classification

- Benchmarked Logistic Regression, SVM, and Random Forest on imbalanced click-log data; recall threshold optimisation cut false negatives by 40%, reducing undetected fraud exposure and producing a dual-audience report on methodology and commercial risk trade-offs.

EDUCATION

MSc Business Analytics and Decision Science — University of Leeds *2025 – 2026*

Forecasting | Machine Learning | Decision Modelling | Data Visualisation | Applied Statistics

B.Tech Computer Science — SOA University *2020 – 2024*

LEADERSHIP

- Directed marketing and security operations for a 500+ attendee university festival — led a team of 8 across 3 workstreams, meeting all delivery targets on schedule and within budget.
- Independently re-engineered Android OS deployments across 2+ device models, cutting boot time by 15% and resolving 5+ system-level bottlenecks.
